John P. Ortiz

Ph.D. Candidate
Johns Hopkins University
Whiting School of Engineering
Department of Environmental Health & Engineering

LANL Experts Profile
johnportiz14.github.io
jportiz@lanl.gov
[redacted]

Areas of Specialization

numerical modeling • hydrogeology • fracture-matrix interactions • reactive transport • planetary science • computational physics model development • petroleum geofluids

Education

Current — Johns Hopkins University (JHU)
Ph.D. Candidate in Environmental Health & Engineering
Dissertation: Subsurface Flow and Transport Processes with Applications to Methane Variations on Mars
Advisor: Dr. Harihar Rajaram

2017 — New Mexico Institute of Mining and Technology (NMT)
M.Sc. in Hydrology
Thesis: The role of fault-zone architectural elements and basal altered zones on downward pore pressure propagation and induced seismicity in the crystalline basement
Advisor: Dr. Mark Person

2014 — Dartmouth College
B.A. in Earth Sciences with Honors
Honors Thesis: Quantifying regional sediment flux from observations of nearshore morphology in the Columbia River Littoral Cell
Advisor: Dr. W. Brian Dade

Planetary Exploration Mission Experience

2023 — TLS-SAM Experiment Proposal, Co-author
Co-authored proposal with members of TLS-SAM (Tunable Laser Spectrometer within the Sample Analysis at Mars) team proposing strategic timing of atmospheric sample experiments for Mars Science Laboratory (MSL) *Curiosity* rover to perform in order to constrain sub-diurnal methane variations at Gale crater, Mars. MSL *Curiosity* successfully executed one of the proposed experiments 23 September, 2023, and a second on 10 December, 2023. Authors: Daniel Lo (Univ. of Michigan), Sushil Atreya (Univ. of Michigan), Scot Rafkin (Southwest Research Institute), Jorge Pla-García (Centro de Astrobiología y Instituto Nacional de Técnica Aeroespacial; CSIC-INTA), John Moores (York University), Daniel Viúdez-Moreiras (CSIC-INTA), John Ortiz.

Honors & Awards

2024 "Spot" Performance Award (January), Los Alamos National Laboratory
For outstanding performance and lasting contribution in support of the Laboratory's mission and values.
From the award: "John's work on understanding methane transport on Mars, funded through an LDRD CSES Student Fellowship, has produced very high quality results gaining high visibility for LANL. His recent *Journal of Geophysical Research: Planets* article was picked up by news servers around the world, including *Newsweek* in the US. Finally, John's results were used to guide sample collection on Mars from the *Curiosity* rover, building new ties between NASA and LANL."

2020 R&D 100 Award Winner (*Amanzi-ATS*), Contributor
Contributed to the Amanzi-ATS multi-phase flow and transport simulator project by augmenting code verification and benchmark tests in addition to maintaining user guide documentation. The code won an R&D 100 Award in September 2020. rdworldonline.com

2018 Top 20 Most Downloaded Recent Papers, Wiley Publishing (*Geofluids*)
Amongst articles published between July 2016 and June 2018, the article "Exploring the potential linkages..." (see Publications & Presentations) was in the top 20 for number of downloads in the 12-months post online publication.

2018 "Spot" Performance Award (May), Los Alamos National Laboratory
Going above and beyond the call of duty under tight and/or emergency deadlines to finish a project deliverable in the form of a software package that rapidly predicts fractured rock gas transport to the earth's surface. Software was delivered to AFTAC (Air Force Technical Applications Center).

Research Funding

The asterisk (*) indicates a grant for which I was not an official PI due to graduate student status, but on which I was the lead writer and researcher.

2021 *CSES Student Fellowship, Planetary Science
In-depth 3-year investigation of subsurface methane transport in fractured rock environments on Mars. Multiple methane transport and release mechanisms will be considered in addition to more accurate atmospheric forcing provided through subsurface-atmosphere coupling of FEHM subsurface simulator and MarsWRF general circulation model. PI: Phil Stauffer (LANL). Co-Is: Roger Wiens (LANL), Harihar Rajaram (JHU), Kevin Lewis (JHU), Anthony Toigo (JHU-APL). Total: $190k ($126k).

2021 New Mexico Small Business Assistance (NMSBA) Program
Provided the client/small-business owner detailed workflow for analyzing natural fluctuations in water levels in wells in order to determine aquifer properties. The workflow is covered in a 150-page user guide that provides detailed instructions for using several pre-existing, Open-source programs to perform the analysis. The workflow will allow the client to quickly and cheaply calculate aquifer properties as an alternative to performing expensive

well pump tests. PI: Phil Stauffer (LANL). Total: $17k ($15k).

2020 New Mexico Small Business Assistance (NMSBA) Program
Seed funding to pursue preliminary work in tidal analysis for a client who owns a small environmental consulting firm. By analyzing water levels in wells in response to earth tides, aquifer properties can be calculated without the need to perform expensive pump tests. Investigated tidal analysis background and methods during the first year of funding and delivered a 20-page report to the client on the feasibility of this method, highlighting a path toward a workflow that could eventually be used by the client. PI: Phil Stauffer (LANL). Total: $17k ($15k).

2020 *CSES Rapid Response Research & Development Grant, Planetary Science
Seed funding for preliminary work and proof-of-concept results of subsurface methane transport in fractured rock environments on Mars influenced by periodic barometric pressure variations. PI: Dylan Harp (LANL). Co-Is: Roger Wiens (LANL), Harihar Rajaram (JHU), Kevin Lewis (JHU). Total: $30k ($24.7k).

Research Experience

2020 - pres. Doctoral Student, GRA (Graduate Research Assistant)
Energy and Natural Resources Security Group (EES-16), Los Alamos National Laboratory

Wrote two successfully-funded LDRD CSES Planetary Science grants (see Research Funding) to pursue work modeling subsurface methane transport at Gale crater, Mars at 70% FTE for three years. Key outcomes were two published first-authored journal articles and co-authorship of a NASA proposal with the TLS-SAM Team for multiple atmospheric sampling experiments to be performed by the MSL *Curiosity* rover, forging new ties between NASA and LANL (see Planetary Exploration Mission Experience and Research Funding).

Carried out programmatic work for government sponsors related to detecting and verifying underground nuclear explosion (UNE) tests. Performed pressure and gas transport predictions to support Low Yield Nuclear Monitoring (LYNM) program. Developed new reactive transport capability into FEHM to interrogate counter-intuitive radionuclide gas transport experimental results in zeolitic rock to improve signal interpretation related to historical UNE test data. Was also the lead developer Numerical Reduced Order Multiphase Model (NROMM) software package for rapid prediction of gas seepage times, which was developed for AFTAC (Air Force Technical Applications Center) as part of a Trailblazer project (see Honors & Awards). Conducted training for end users of NROMM to members of the 21st Surveillance Squadron of AFTAC (see Workshops Facilitated).

Lead a NMSBA (New Mexico Small Business Assistance; https://www.nmsbaprogram.org/) project (2021-24) to help a small environmental consulting firm reduce costs associated with interpreting aquifer hydrogeologic properties from well data. Demonstrated the use of frequency domain analysis and solid-Earth tidal loading to estimate hydrogeologic properties without the need for expensive pump tests.

2017 - 2019 Post-Master's Student, GRA
Computational Earth Science Group (EES-16), Los Alamos National Laboratory

Lead developer of the Numerical Reduced Order Multiphase Model (NROMM) software package for rapid prediction of gas seepage times. Software application was developed for use on multiple platforms (Windows/Linux/MacOS).

Developed numerical approaches for detecting and verifying underground nuclear explosion (UNE) tests. Projects includes simulating radionuclide gas transport in fractured geologic media using finite-element method (FEM) and control volume finite-element (CVFEM) numerical models, simulating high-pressure methane injection into shale samples to inform laboratory investigations, and determining laboratory- and field-scale transport properties of rocks using models and tracer experiments.

Contributed to development of the Amanzi-ATS high performance computing (HPC) flow & transport simulator to meet the Nuclear Quality Assurance-1 (NQA-1) regulatory standard by improving code verification and benchmark tests in addition to maintaining software user guide documentation. Collaborated on a multi-lab program supported by the DOE Office of Environmental Management (DOE EM) to provide scientifically defensible and standardized assessments of the uncertainties and risks associated with the environmental cleanup and closure of waste sites. This software won an R&D 100 Award in September 2020 (see Honors & Awards).

2016 - 2017 Graduate Research Assistant
Earth and Environmental Sciences Department, NMT

Created transient 3D finite-difference (FDM) models in MODFLOW to analyze fluid-fault interactions pertaining to a suite of basal reservoir injection scenarios. Also developed transient 2D cross-sectional FDM models in MATLAB to test fluid-fault interactions for crystalline basement fault zones exhibiting local, dynamically enhanced permeability caused by excess fluid pressures. In my work, I developed new approaches for representing fault zones with multiple architectural components and identified several key hydrogeologic parameters that control deep propagation of the fluid pressure envelope and thus present increased risk of induced seismic events.

Collaborated on an NSF-funded (via NM EPSCoR) field project deploying subsurface field survey equipment (transverse electromagnetics [TEM], magnetotellurics [MT]) for interpretation of deep saline geothermal flow regimes in order to evaluate potential hydrothermal systems in southern New Mexico.

2013 Research Intern
College of Earth, Ocean, and Atmospheric Sciences, Oregon State University

Completed an NSF-funded Research Experience for Undergraduates (REU) internship on coastal processes by collecting and interpolating nearshore topographic and bathymetric data to extract key spatial and temporal metrics using MATLAB. Determined rates of longshore-uniform sandbar migration cycles along the Oregon and Washington coasts representing a huge component of seasonal coastal sediment flux.

2013 Research Intern
United States Army Corps of Engineers Field Research Facility, Duck NC

Studied coastal evolution and erosion by collecting and processing LiDAR observations during and after storm surges.

Created a paleo-hurricane record of St. Croix by performing grain-size analysis on sediment cores combined with charcoal carbon dating.

Workshops & Shortcourses

Workshops Facilitated

2021 NROMM Demo and Training for AFTAC
Led a training and software demonstration for members of the AFTAC 21st Surveillance Squadron on use of the NROMM software package (see Honors & Awards).

Relevant Shortcourses

2023 LYNM Underground Nuclear Weapons Testing Orientation Program (UNWTOP)
Nevada National Security Site (NNSS), Las Vegas, NV
Attended 4-day multi-lab program at the NNSS for orientation regarding history, challenges, and science topics related to underground nuclear weapons testing.

Teaching Experience

2019 Grading Assistant
Environmental Health & Engineering Department, Johns Hopkins University
Graded weekly homework assignments for 20+ upper-level undergraduate engineering students in an Introduction to Fluid Mechanics course. Occasionally taught course lectures as needed.

2015 - 2016 Graduate Teaching Assistant
Earth and Environmental Sciences Department, NMT
Developed lesson plans and led class lectures and field trips for 20+ students in intermediate and upper level undergraduate Earth Sciences lab sections. Taught lab sections for courses in both Geomorphology and Stratigraphy & Paleontology with work load totaling 20 hrs/week.

Skills

Programming/command languages

Python – High proficiency in designing and executing sensitivity analyses of FEHM and PFLOTRAN numerical models and generating nodal grids for finite-element meshes. Have also developed a standalone software application for real-time predictions of gas breakthrough for use on Windows, Linux, and MacOS platforms.

Matlab – High proficiency in writing scripts for data processing and developing a variety of iterative/numerical models to solve hydrogeologic environmental problems.

Fortran – Intermediate proficiency in augmenting current and legacy flow and transport codes (e.g., FEHM). Added reactive transport capability allowing for competitive kinetic adsorption between multiple tracer species. Maintainer of a Mars-specific branch of FEHM (FEHM-Mars; https://doi.org/10.5281/zenodo.10455952) that features code modifications to adapt to martian conditions (e.g., reduced gravity, equation-of-state modifications

for Mars "air") and a capability allowing users to specify time-varying distribution coefficients for tracer adsorption problems.

R – Intermediate proficiency in building a variety of statistical models to interpret and synthesize climatic, hydrologic, geochemical, and environmental data. Collaborated on statewide New Mexico water budget research project predicting reference evapotranspiration using different statistical models on a wide range remote sensing parameters.

LaTeX – High proficiency in typesetting/document preparation of technical and scientific documentation.

Bash/shell

Software, codes

Fehm – High proficiency in creating multi-phase fluid flow simulations with mass transport. Created test suites comparing vapor tracer transport within a fracture with matrix diffusion to an analytical solution governed by a modified Richard's equation for unsaturated flow (with immobile liquid phase) in order to test when multi-phase flow significantly affects gas tracer transport. github.com/lanl/FEHM

Pflotran – Intermediate proficiency in creating multi-phase fluid flow simulations with mass transport. Created test suites in similar capacity to work done with FEHM. Also used in conjunction with FEHM to validate the capabilities of discrete fracture networks (DFNs) to simulate flow/transport in fractured media under transient conditions. www.pflotran.org

LaGriT – Intermediate proficiency in generating numerical finite-element meshes for a variety of geological applications, including porous flow and transport modeling and discrete fracture networks. Proficient at generating meshes using the 3 interfaces: command line, batch driven via control file, and PyLaGrit Python command/batch interface. Have also worked on capability development by using novel approaches to combine continuum 3D grids with 2D discrete fracture network (DFN) planes into unified meshes for use in transient flow and transport models. lagrit.lanl.gov/index.shtml

dfnWorks – Intermediate proficiency in generating 3D discrete fracture networks (DFN) for simulating flow and transport, including generating continuum representations of fractured porous media with octree refinement using an upscaled discrete fracture matrix model (UDFM) workflow. dfnworks.lanl.gov

Modflow – High proficiency in developing 3D transient and steady-state FDM models to solve a variety of hydrogeologic problems including fluid-fault interactions as related to induced seismicity in thesis work, and basin-scale backwards modeling of groundwater solute transport as related to the Kirtland Air Force Base spill in Albuquerque, NM.

OpenFOAM – Intermediate proficiency in developing computational fluid dynamics (CFD) simulations of single and multi-phase flow and transport simulations in laminar and turbulent regimes.

SPOTL: Some Programs for Ocean-Tide Loading – Intermediate proficiency in computing load tides and strains produced on the solid Earth by both ocean tides and solid-Earth body tides. https://igppweb.ucsd.edu/~agnew/Spotl/spotlmain.html

Sphinx – High proficiency in generating and maintaining professional documentation of

software projects as HTML and LaTeX output from reStructuredText sources.

Git – High proficiency in source code management/version control in application development and collaborating with colleagues on coding/software projects. Have experience maintaining Git repositories as a lead developer as well as in a supporting collaborator role.

ParaView – Intermediate proficiency in interactive scientific visualization and exploration by representing data in static figures and videos. www.paraview.org

GDB (GNU Debugger) – Intermediate proficiency with command line debugging tool for current and legacy flow and transport codes.

Petromod – Intermediate proficiency in creating basin evolution, subsidence rate, and heat flow models of petroleum-bearing locales.

ArcGIS – Intermediate proficiency in using digital elevation models (DEM) to delineate watersheds and create estimates of stream discharge in mountainous terrain.

Adobe Illustrator – High proficiency in creating and editing publication-ready figures and illustrative schematic diagrams and animations.

Microsoft Excel – Ranked #7 in the world at the 2008 Microsoft Office Worldwide Competition in Hawaii of 56,000 initial entrants (www.betheworldchamp.com), Ireland National Champion (of 436 entrants).

Other

Advanced proficiency in written and conversational Spanish (nine years of academic study).
